Hydro energy conversion

Hydraulic design of hydro power plant

(H : Head, $\rho_{H_2O} = 1000 \text{ kg/m}^3$):

Potential energy of barraged water:

$$W_{pot} = m \cdot g \cdot H = \rho_{H_2O} V \cdot g \cdot H$$

Power:

$$P_{in} = W_{pot} / t = \rho_{H_2O} \cdot (V / t) \cdot g \cdot H = \rho_{H_2O} \cdot \dot{V} \cdot g \cdot H$$

$\dot{V}$: Water flow rate

Efficiency chain:

Hydraulic efficiency: 0.95

Turbine efficiency: 0.9

Generator efficiency: 0.98

Power plant energy consumption: 0.97

Resulting efficiency of power plant: $\eta_{KW} = 0.95 \cdot 0.9 \cdot 0.98 \cdot 0.97 = 0.81$

Electrical power: $P_{out} = P_e = \eta_{KW} \cdot P_{in} = 0.81 \cdot 9.81 \cdot 1000 \cdot \dot{V} \cdot H$

"Rule of thumb": $P_e = 8000 \cdot \dot{V} \cdot H$, $[P_e] = W, [\dot{V}] = m^3 / s, [H] = m$

Classification of hydro power plants

- High head, low flow rate
- Medium head, medium flow rate
- Low head, high flow rate

*) 3 gorges *Xi-Ling, Wu, Qutang* at *Yangtsekiang* river (barrage: 2 km width, 600 km length)

**) Height of *Grad Dixence* barrage 285 m: bigger than *Eiffel-tower* in *Paris/France*.

Low head	Medium head	High head	High head
High flow rate	Medium flow rate	Low flow rate	Low flow rate
River plant	River barrage plant	Pump storage plant	Pump storage plant
<i>Wallsee/Austria</i>	<i>3 Gorges/China*)</i>	<i>Kaprun/Austria</i>	<i>Bieudron/Switzerland</i>
$H = 9.1 \text{ m}$	$H = 183 \text{ m}$	$H = 780 \text{ m}$	$H = 1883 \text{ m **)}$
$\dot{V} = 2880 \text{ m}^3/\text{s}$	$\dot{V} = 12295 \text{ m}^3/\text{s}$	$\dot{V} = 32 \text{ m}^3/\text{s}$	$\dot{V} = 86 \text{ m}^3/\text{s}$
$P_e = 210 \text{ MW}$	$P_e = 18000 \text{ MW}$	$P_e = 200 \text{ MW}$	$P_e = 1295 \text{ MW}$
Kaplan-Turbines	Francis-Turbines	Pelton-Turbines	Pelton-Turbines
6 Generators, each 35 MW	26 Generators, each 692 MW	4 Generators, each 2x55 MW, 2x45 MW	3 Generators, each 432 MW

Classification of hydro generator operation

- Mainly **fixed speed operation** directly at the grid, usually no inverter !
- “**Small hydro**” : Cage induction generators with gear, permanent magnet synchronous generators, or electrically excited synchronous generators to allow over-excited power generation

Unit power: several 100 kW ... Several MW

- “**Big hydro**” : Electrically excited synchronous generators, allowing over-excited power generation, gearless = directly coupled to turbine

Unit power: Several MW ... Several 100 MW

- **Typical speed**: Synchronous generators: $n = f_s/p$
 - High head, low flow rate: high speed 750 ... 1000 ... 1500/min
 - Medium head, medium flow rate: medium speed 200 ... 500 /min
 - Low head, high flow rate: low speed 80 ... 200 /min

Pelton turbine data - Over speed at load drop

Example: Simple estimation:

- Power plant *Bieudron/Wallis*, Switzerland:
- Speed of water jet: $v_1 = 600 \text{ km/h} = 166.6 \text{ m/s}$.
- Circumference speed of turbine runner:
theoretically $v_u = v_1/2 = 83.3 \text{ m/s}$
in reality due to losses: $v_u = 103.5 \text{ m/s} = d\pi n$.
- With a runner diameter of $d = 4.65 \text{ m}$ we get a rated speed of $n = 428.6 \text{ /min}$.
- At load dropping: Water jet speed = circumference speed:
Over speed: $166.6/103.5 = 1.61$; in reality: 1.86-fach: $n_{max} = 800/\text{min}$

Generator data:

Salient pole electrically excited synchronous machine:
432 MW, 465 MVA ($\cos\varphi = 0.93$), Generator mass 800 t
 $2p = 14$, 50 Hz, 428.6 /min, 21 kV, 12.78 kA.

Induction generators are an inductive load: Compensation by capacitor banks necessary , so PM-Synchronous generators preferred: lower losses, no compensation needed, as it operates at unity power factor !
